## REPORT.

#### TO THE

### RIGHT HONBLE. H. AUSTIN BRUCE, M.P.

Her Majesty's Principal Secretary of State for the Home Department.

GENERAL REGISTRY OFFICE OF BIRTHS, Etc., Edinburgh, March 25, 1870.

SIR,

I HAVE the honour to submit to you a General Abstract of the Births, Deaths, and Marriages registered in Scotland during the year 1869, in conformity with the requirements of the Scottish Registration Act (17° and 18° Vict. c. 80), in order that the same may be laid before Parliament.

As in my former Reports, I have directed that this Abstract should be accompanied by a short explanatory statement as to the health of the population during the year, the diseases which were prevalent, and the causes which seemed to affect the proportions of the Births, Deaths, and Marriages.

From the mode in which we divide Scotland into districts, according to the density of the population, I have been enabled to prove that density of population increases the Births and Marriages nearly in the exact ratio that it increases the Deaths. This is a most important fact, as bearing on the question of sanitary reform, and one to which I wish to direct your attention.

As the period is now approaching when preparations must be made for taking the Census of the people in 1871, and it is desirable to make any inquiries which may throw light on various social questions, I have directed that in this Report there should be given a summary of the various facts which have been ascertained as to the prevalence and supposed causes of illegitimacy in Scotland.

The year 1869 having proved quite an exceptional one, both with regard to its high mortality and its meteorological phenomena, I directed that special attention should be paid to that subject, with the view of tracing the causes which led to the excessive Death-rate. Several additional Tables are therefore added to this Report, with the view of throwing light on the subject.

In terms of the Nineteenth Section of the Scottish Vaccination Act (26° and 27° Vict. c. 108), I have also the honour to submit to you my Fifth Annual Report on Vaccination, containing a general abstract of the number of children born during 1868 who have been successfully vaccinated, who were insusceptible of the vaccine disease, whose vaccination was postponed, who died before vaccination, and the other particulars required by the Statute.

The success of the Scottish Vaccination Act may be said to be nearly as complete as any legislative enactment could effect, inasmuch as 97.5 per cent. of the children born during the year 1868 have been protected by vaccination, or are otherwise accounted for under the provisions of the Statute. Under its operation, also, Small-pox has greatly diminished; so that it may be said, that for the last five years the mortality from Small-pox has been very much lower in Scotland than during any previous period of which we have any knowledge. The introduction of a few important amendments would remove most of the hard-ships at present complained of, to some of which I have made special allusion in my former Reports.

I have the honour to be,

SIR,

Your obedient Servant,

W. PITT DUNDAS,

Registrar-Ĝeneral.

# REPORT TO THE REGISTRAR-GENERAL,

BY JAMES STARK, M.D., F.R.S.E.

SIR,

This Report refers to the Births, Deaths, and Marriages registered during the year 1869 in the 1016 districts into which Scotland was that year divided for the purposes of registration, and also to the vaccination of the children whose births were recorded during the year 1868.

113395 Births, 75789 Deaths, and 22083 Marriages were entered on the registers of Scotland during the year referred to; and when these numbers are compared with the estimated population, it appears that the proportion of births and of marriages was below the mean of the ten previous years, while the proportion of deaths was considerably above it. As compared with the year 1868, there were 2278 fewer births, 6403 more deaths, and

230 more marriages.

When these Reports were first commenced, with the view of aiding sanitary inquiries, and, if possible, of discovering the laws which regulate the proportion of births, deaths, and marriages, and discovering whether these events bore any relation to each other, the districts of Scotland were divided into two groups, viz.:—1st, Town Districts, embracing all the districts which contained towns with a population of 3000 and upwards; and 2d, Rural Districts, embracing the remainder of Scotland. Year after year it was found that the closest possible relation existed between the births, deaths, and marriages in each of these groups of districts; for

Table I.—Population of Scotland, estimated to the middle of each year; Births, Deaths, and Marriages registered during each year from 1855 to 1869 inclusive; the Illegitimate Births, and the excess of Births over Deaths; also the Per-centage of Births, Deaths, and Marriages to the Population.

while all were uniformly high in the Town, all were uniformly low in the Rural Districts. The year just closed was no exception to this rule, for in the 131 Town Districts, for every ten thousand persons there occurred the proportion of 388 births, 285 deaths, and 82 marriages; while in the Rural Districts the proportion was only 311 births, 175 deaths, and 51 marriages.

These facts show, in a general way, that life wore out more rapidly in the towns than in the country; but that to supply this greater waste of life, there were more marriages and more births, so that a perfect compensation

was maintained.

The progress of knowledge, however, rendered it imperative to ascertain whether in all cases the proportion of births, deaths, and marriages kept pace with the density of the population, or rather with the size of the mass of human beings congregated together. To eliminate this important point, the districts of Scotland were divided into four groups:—1st, Principal Towns, each of which have above 25,000 inhabitants; 2d, Large Towns, each of which have from 10,000 to 25,000 inhabitants; 3d, SMALL Towns, each of which have from 3000 to 10,000 inhabitants; and 4th, Rural Districts, which embrace the remaining districts of Scotland. It then appeared that the proportion of births, deaths, and marriages in each of these four groups of districts rose with the density of the population,—that the proportion of all was highest in the Principal Towns, was next highest in the Large Towns, smaller in the Small Towns, but lowest of all in the Rural Districts.

Thus, in 1869, for every ten thousand persons in each of these groups, there occurred the proportion of 408 births, 325 deaths, and 94 marriages in the Principal Towns; 383 births, 276 deaths, and 75 marriages in the Large Towns; 351 births, 222 deaths, and 63 marriages in the Small Towns; but only the low proportion of 311 births, 175 deaths, and 51

marriages in the Rural Districts. (Tables V. and VI.)

A ten years' abstract of the births, deaths, and marriages in Scotland, viz. for the years 1856-1865, showed the same fact—that all these events occurred in each of the four groups of districts according to the density of the population. Thus, during these ten years, for every ten thousand persons in each of these four groups there occurred 387 births, 282 deaths, and 89 marriages in the Principal Towns; 380 births, 245 deaths, and 79 marriages in the Large Towns; 364 births, 212 deaths, and 69 marriages in the Small Towns; but only 314 births, 169 deaths, and 56 marriages in the Rural Districts.\*

Table II.—Population of Scotland estimated to the middle of each year from the Excess of Births over Deaths, deducting Emigrants, and the Per-centage of Births, Deaths, and Marriages to that Population; also, the Annual Increase or Decrease of Births, Deaths, and Marriages.

<sup>\*</sup> See Thirteenth Detailed Annual Report of Registrar-General of Scotland, p. xvi., Tables XIV. and XV.

These facts, then, seem to prove, that it is a law of nature that births, deaths, and marriages are equally influenced by density of population.

### POPULATION.

In a small country like Scotland, where the known emigration to America and the Colonies, and the unknown emigration to England, Ireland,

TABLE III.—Number of Births, Deaths, and Marriages in Scotland, and their Proportion to the Population, estimated to the middle of each year, during each Quarter of the Years 1859 to 1869 inclusive.

etc., bears such a large proportion to the population, the estimated population towards the close of the decennial period since last Census was taken must be regarded as merely an approximation to the truth. To allow, however, of every one making what corrections he pleases on our estimate, and also to show how the proportions of births, deaths, and marriages would look when the population is differently estimated, there is appended another Table (Table II.), which shows what the number of the population would be during each year from 1861 to 1869 were the ascertained emigrants deducted from the excess of births over deaths. This Table, of course, makes no allowance for the large migration to England and Ireland, the continent of Europe or India, nor for the drafts to the army and navy. By our adopted mode of estimation, the population of Scotland at the middle of the year 1869 would amount to 3,205,481 persons. By the system adopted for Table II., it would amount to 3,291,333 persons. The actual population is probably something between these numbers.

#### BIRTHS.

113395 Births were registered in Scotland during the year 1869,—a number lower than that of the three previous years, but just what might have been expected from the diminution of marriages during the years 1867 and 1868. During the ten years 1859–1868, the mean annual birthrate was in the proportion of 354 births in every ten thousand persons of the estimated population, or 3.54 per cent.; but during the year 1869 the proportion was 353 births in a like population, or 3.53 per cent.

Of these 113395 births, 976306 were registered in the Principal Towns, 277658 in the Large Towns, 535408 in the Small Towns, and 1425109 in the Rural Districts; giving for every thousand persons in each of these groups a proportion of 40 births in the Principal Towns, 38 births in the Large Towns, 35 births in the Small Towns, but only 31 births in the Rural Districts. (Tables V. and VI.) The influence of density of popula-

tion on the births was therefore most strongly marked.

Even the Eight Divisions of Scotland showed, in a general way, the influence of density of population on the births. Thus, in the North-Western Division, with 23 persons to a square mile, there were 26 births to every thousand persons; in the Southern Division, with 66 persons to

TABLE IV.—Estimated Population, with the Births, Deaths, and Marriages registered in each of the Eight Divisions of Scotland during the Year 1869, and their Proportion to the Population.

Deversors	Population estimated	BIRT	HS.	DEAT	HS.	MARRIAGES.

Southern	212,847	6393	3.00	3860	1.81	1141	0.53	

a square mile, there were 30 births to every thousand persons; in the North-Eastern Division, with 96 persons to a square mile, there were 33 births to every thousand persons; in the East-Midland Division, with its 119 persons to a square mile, there were 34 births to every thousand persons; in the South-Eastern Division, with 219 persons to a square mile, there were 37 births to every thousand persons; while in the populous South-Western Division, with 441 persons to every square mile, there were 40 births to every thousand persons. (Table IV.)

Of the 113395 births, 102372 were legitimate and 11023 illegitimate, -indicating that 9.7 per cent. of the births were illegitimate. As usual, the proportion of illegitimate births was lower in the Town than in the Rural Districts. Thus, in the Principal Towns, 9.7 per cent. of the births were illegitimate, 7.5 per cent. in the Large Towns, 9.7 per cent. in the Small Towns, but 10.2 per cent. in the Rural Districts. It is singular that year after year the proportion of illegitimate births in the North-Eastern and Southern Divisions continues so very much above that of all the others; for while only 6.4 per cent. of the births were illegitimate in the North-Western, 7.3 per cent. in the Northern, and 8.3 per cent. in the

<sup>\*</sup> The Large Towns have Populations from 10,000 to 25,000 persons. The Small Towns have Populations from 3,000 to 10,000 persons.

populous manufacturing, mining, and commercial South-Western Division, 14.6 per cent. of the births were illegitimate in the North-Eastern, and 15.4 per cent. in the Southern Divisions. It would be well that the probable causes of this very high rate of illegitimate births should be thoroughly

inquired into.

As the approaching Census of the population will afford a favourable opportunity for investigating facts which throw light on various social problems, it may not be out of place to give a summary of the conclusions which have been already arrived at in these Reports, relative to various causes which were considered to influence the proportion of illegitimate births. The full details on which these conclusions were founded were published in the Detailed Annual Reports for the years 1855 to 1860 inclusive.

We have always maintained that illegitimacy in Scotland is different from illegitimacy on the Continent of Europe, inasmuch as it presents some features which seem to indicate that it has its origin in a different condition of the social relations. Thus, in all the kingdoms of the Continent of which we possess statistics, the illegitimate births are low in the Rural Districts, but rise to enormous dimensions in the Towns. in France, while only 4 per cent. of the births are illegitimate in the Rural Districts, 20 per cent. are illegitimate in the Towns, and from 27 to 32 per cent. in Paris. In Belgium, while only 5.7 per cent. of the births are illegitimate in the Rural Districts, 13.6 per cent. are illegitimate in the Towns, and 31.8 per cent. in Brussels. In Sweden, while only 7.8 per cent. of the births are illegitimate in the Rural Districts, 24.2 per cent. are illegitimate in the Towns, and 41.2 per cent. in Stockholm. In the Austrian Empire, in 1856, 13 per cent. of the births were illegitimate; but in Lower Austria, which includes Vienna, 47 per cent. of the births were illegitimate.

All this is opposed to the facts ascertained with regard to illegitimacy in Scotland; for a ten-yearly period shows that illegitimacy is less prevalent in the Towns than in the Rural Districts, seeing that only 9.0 per cent. of the births were illegitimate in the Towns, but 9.9 per cent. in the Rural

Districts.

Again, on the Continent of Europe it has been invariably found that the proportion of males to females in the illegitimate births was much smaller than what occurred in the legitimate births. Thus, in Belgium, 105.5 males are born to every 100 females in the legitimate births, but only 102.5 males to every 100 females in the illegitimate births. In France, 105.5 males are

born to every 100 females in the legitimate births, but only 103.3 males to every 100 females in the illegitimate births. In Sweden, 106.0 males are born to every 100 females in the legitimate births, but only 103.5 males to every 100 females in the illegitimate births.

In Scotland this is reversed, the proportion of males in the illegitimate births exceeding that of the males in the legitimate births. Thus, take the thirteen years 1855 to 1867, 105.4 males were born to every 100 females in the legitimate births, but 106.7 males to every 100 females in the illegitimate

births.

It was pointed out in our First Detailed Annual Report, and every subsequent year has confirmed the conclusion, that the illegitimate births were almost entirely confined to the lower, that is, to the labouring and working classes; and that the mothers of such children consisted chiefly of those employed about farms or in agricultural labour, of factory girls, of domestic servants, and those engaged in needlework and in shops. Private investigations showed, that in numerous instances the parents of these illegitimate children were true to each other, that the woman had borne several children to the same man, and that frequently these children were legitimated by the subsequent marriage of the parents. By this law, not only was the proportion of illegitimate persons in the population reduced, but possibly one of the strongest motives to infanticide was removed, inasmuch as the woman may have lived in the hope that the birth of the child would eventually be the means of inducing its father to marry her, and thus legitimate their offspring.

In so far as the registers could show such a fact, it was ascertained that in the great majority of cases the father of the illegitimate child belonged to the same rank as the mother; and this agrees with the observation of independent inquirers who have turned their attention to this subject.

In our Tenth Detailed Annual Report was given a Table showing the proportion of illegitimate births in every division and county of Scotland during the ten years 1855-1864. This Table, when compared with the proportion of those able to sign their names in writing in the marriage registers, confirms the conclusion drawn in former Reports, that there is no traceable connection between the ignorance, or want of education, among the people, and the proportion of illegitimacy Indeed, instead of the uneducated counties showing the highest proportion of illegitimate births, it was rather the reverse, seeing that the counties in which the proportion of illegitimate births was highest, were also those in which the highest proportion of men and of women were able to sign their names in writing in the marriage registers. Thus, in Ross and Cromarty, where only 3.9 per cent. of the births were illegitimate, only 60 per cent. of the men, and 45 per cent. of the women were able to sign their names in writing. In Inverness, where 7.6 per cent. of the births were illegitimate, only 71 per cent. of the men, and 53 per cent. of the women were able to sign their names in writing. In Lanark, where 7.4 per cent. of the births were illegitimate, only 84 per cent. of the men, and 69 per cent. of the women were able to sign their names in writing. On the other hand, in Aberdeen, where 15.3 per cent. of the births were illegitimate, 97 per cent. of the men, and 92 per cent. of the women were able to sign their names in writing. In Banff, where 15.5 per cent. of the births were illegitimate, 96 per cent. of the men, and 85 per cent. of the women signed their names. And in Dumfries, where 14.4 per cent. of the births were illegitimate, 97 per cent. of the men, and 95 per cent. of the women were able to adhibit their signatures in the registers.

These striking facts, then, seem to prove that the large proportion of illegitimacy in these highly educated counties is not a sin resulting from ignorance and debasement; for every one who is acquainted with these counties knows how intelligent are the natives, and that in other respects they are of a somewhat higher cast than the generality of the inhabitants of

those counties where illegitimacy is not nearly so prevalent.

It is by no means easy to arrive at definite conclusions relative to the effect of proportion of marriages on illegitimacy, because another element comes into consideration, viz. the fact that the proportion of marriages is increased by density of population. Allowing for this, however, it appears that the counties and divisions in which illegitimacy occurs to the highest extent are those in which the proportion of marriages is low. Thus, if we contrast the North-Eastern and Southern Divisions of Scotland, in which above 14 per cent. of the births are usually illegitimate, with the South-Western and South-Eastern Divisions, in which only from 7 to 8 per cent. of the births are illegitimate, we shall find that the proportion of marriages in the North-Eastern and Southern Divisions was only 63 and 55 marriages respectively in every ten thousand persons, whereas in the South-Western and South-Eastern Divisions they were in the proportion of 80 and 81 marriages respectively in every ten thousand persons.

These facts seem to indicate, that in certain counties of Scotland some prudential or other checks to marriage must prevail; and it is believed that a considerable amount of the illegitimacy which these counties exhibit is the result of something approaching to concubinage, although in most instances where such a connection subsists the parties do not

actually live together.

Much of the illegitimacy prevailing in certain counties was at one time attributed to the existence of what are called bothies, that is, houses apart from the farm-house, in which the male and female workers on the farm are separately lodged. These bothies only exist on the large farms, and if they had any influence in increasing the illegitimacy, the proportion of illegitimate births would have been found to be highest in those counties which had the largest arable farms. It is a known fact that the smaller the size of the farm the more it is worked with the assistance of young unmarried men and women, who are fed in the house, and sleep either in the house or in the stable-loft or offices. It is only on the large farms that married men are employed; so that, in many districts, so soon as a young man marries he loses his situation as a ploughman, and is forced to become a daily labourer, dependent on his daily work for his bread. This, of course, acts as a strong check on his openly marrying.

An official return was published in 1857, which, to a certain extent, enables us to trace the effect of the size of the farm on the proportion of illegitimate births in each county of Scotland; and it is instructive to note that, in a general way, the illegitimacy was found to be highest in those counties in which the smallest farms occurred. Thus, in Banff, the farms paying £20 and upwards of annual rent, only averaged 64 acres each, and 15.5 per cent. of the births were illegitimate annually. In Aberdeen, the farms paying £20 and upwards of rent, only averaged 66 acres in extent, and 15.3 per cent. of the births were annually illegitimate. In Dumfries, the average size of the farms paying £20 and upwards was 87 acres only, and the high proportion of 14.4 per cent. of the births was illegitimate annually. In Kirkcudbright, the average size of the farms paying £20 and upwards was 88 acres, and 13.4 per cent. of the births were

married men are employed, and bothies are, of course, more common. In the county of Edinburgh, the average size of farms paying £20 and upwards was 114 acres, and among the rural population only 8 per cent. of the births were illegitimate. In Fife, the average size of the farms above £20 of yearly rental was 110 acres, and only 7.6 per cent. of the births were illegitimate. In Haddington, the average size of the farms above £20 of yearly rental was 219 acres, and only 8.7 per cent. of the

Many years ago an attempt was made to show that 'the excess of female life is mainly at the root of that evil—illegitimacy.' Every known fact, however, both with regard to Scotland and other countries, contradicts such a theory. Thus, in the Northern Division of Scotland, which includes the counties of Shetland, Orkney, Caithness, and Sutherland, there were 121 females for every 100 males in 1861. Here, by that theory, the highest proportion of illegitimate births ought to occur; but, on the other hand, no division had such a low proportion, seeing that a ten years' average shows that only 5.4 per cent. of the births were illegitimate. The North-Western Division contains the next highest proportion of females to males, viz. 114 females to every 100 males; and it contained the second lowest proportion of illegitimate births, viz. 5.7 per cent. of the births.

On the other hand, the two divisions which contain the average Scottish proportion of females to males,—viz. the North-Eastern and Southern Divisions,—viz. 111 females to every 100 males, are those which yielded the highest proportion of illegitimate births, viz. 14.7 and 13.4 per cent. of the

births as illegitimate.

births were illegitimate.

But the whole statistics of the Continent of Europe as well as of Scotland prove the same fact—viz. that excess of female life has no effect whatever in increasing illegitimacy.

Thus, Scotland has 111 females to every 100 males in her population, and a ten years' average shows that 9.1 per cent. of the births are

illegitimate.

Denmark has a nearer equality of the sexes than almost any other kingdom, viz. 100.8 females to every 100 males, and 9.3 per cent. of her births are illegitimate.

In Hanover, the sexes are still more nearly equal, viz. 100.3 females

to every 100 males, yet 10.1 per cent. of her births are illegitimate.

Austria has only 102.9 females to every 100 males, yet 13 per cent. of her births are illegitimate.

Bavaria has only 103 females to every 100 males, yet 21.9 per cent.

of her births are illegitimate.

Saxony has only 104.5 females to every 100 males, yet 14.8 per cent.

of her births are illegitimate.

Sweden, which makes the nearest approach of the continental kingdoms to Scotland in the proportion of her sexes, has 106.3 females to every 100 males, and 9.3 per cent. of her births are illegitimate.

Every reliable fact, therefore, fails to establish the theory which ascribes the prevalence of illegitimacy to the excess of female life. Every one knows that the female is far more virtuous and continent than the male; and the converse of the proposition in question would be much nearer the truth.

Many are disposed, not unnaturally, to attach great weight to the insufficiency of house accommodation as one mode of accounting for the prevalence of illegitimacy. It is argued that, where there is insufficient

accommodation for a family, and a necessary impossibility of observing the common decencies of social life, no other result, in regard to the females especially, could be looked for than a loss of that modesty and innate delicacy which are the best safeguards in afterlife. That overcrowding may have a pernicious effect, is what no one probably will be prepared to deny; but a comparison of the returns as to house accommodation with those of illegitimacy in the different divisions and counties of Scotland, seems to show that other causes, as yet unknown, are at work in producing effects so greatly to be deplored.

If the proportion of illegitimate births depended on the amount of house accommodation, it would be found that, in every county or division of Scotland, the proportion of illegitimate births would bear some proportion to that of the number of families living in houses of one room. As we have a perfect return of the house accommodation of all classes in Scotland, we have the data whereby we may estimate the effect which such a state of matters exercises on the point now under consideration; and that return, invaluable in many respects, is in none more remarkable than in proving that the effect of deficient house accommodation in increasing the proportion

of illegitimate births is less than is generally supposed.

Thus, a ten years' summary of the proportion of illegitimate births in the divisions and counties of Scotland, shows that by far the highest proportion of illegitimate births occurs in the North-Eastern and Southern Divisions; while the smallest proportion occurs in the Northern and North-Western Divisions, the other four divisions occupying an intermediate place. In the North-Eastern Division, which includes the counties of Nairn, Elgin, Banff, Aberdeen, and Kincardine, only 25.2 per cent. of the families lived in houses of one room, yet 14.7 per cent. of the births were illegitimate; that is to say, that the division which had the very smallest proportion of its inhabitants living in houses of one room, was also the division which year after year yielded the very highest proportion of illegitimate births.

Contrast with this the Northern Division, which includes the counties of Shetland, Orkney, Sutherland, and Caithness. There 36.7 per cent. (being a full third more than in the North-Eastern Division) of the families lived in houses of one room, yet only 5.4 per cent. of the births were

illegitimate.

Contrast it even with that division which is the far worst as to house accommodation in all Scotland. In the South-Western Division, which includes the counties of Renfrew, Ayr, and Lanark, no fewer than 40.6 per cent. of the families live in houses of one room; yet, instead of this increasing the proportion of illegitimate births above what they are in the North-Eastern Division, they were not half so numerous, seeing that only 7.5 per cent. of the births were illegitimate in the South-Western Division.

Contrast with each other even the adjoining South-Western and Southern Divisions. The former had 37·1 per cent. of its families living in houses of one room, yet only 8·4 per cent. of its births were illegitimate; the latter had only 34·2 per cent. of its families living in houses of one

room, yet 13.4 per cent. of its births were illegitimate.

The influence of the social evil on illegitimacy, either in the way of increasing or diminishing it, we have been unable to trace in Scotland; though in some of our seaport towns, as Leith and Greenock, it certainly seems to have the effect of diminishing the proportion of illegitimate births.

It is thus seen that we are nearly as far as ever from the solution of

the problem as to the causes of illegitimacy, and as to the reason why the proportion in some counties should always be double what it is in others. The non-influence of all the above examined causes seems to point out that the special cause must be sought for in the habits of the people, their greater or lesser addiction to night courtships, to the want of moral training, and to the incontinence of youth, which in some counties finds its legitimate channel in marriage, though it may be in improvident marriage, while in others the prudential check operates so strongly that it leads to that form of non-resident concubinage which results in illegitimacy.

But while the causes of illegitimacy seem at present to be obscure, the extent of the illicit intercourse which leads to the birth of illegitimate children is quite capable of being pretty accurately calculated. Thus, if we take the ten years 1856-1865, and compare the mean annual number of legitimate and illegitimate births with the number of the married and unmarried women at the childbearing ages, viz., from 15 to 45 years of age, we arrive at the following conclusions. During that period the mean number of married women, between the ages of 15 and 45 years, was 305524, and they produced annually 97021 legitimate children, being at the rate of one child for every 3.15 married women at the childbearing ages, or 100 children for every 315 wives. During the same period there were annually born 10004 illegitimate children; and as we may safely assume that the unmarried women who bore these children produced them in the same ratio. as the married women, this would show that 31512 unmarried women in Scotland, between the ages of 15 and 45 years, annually put themselves in the way of being mothers, being one in every 13 of the unmarried women between the ages of 15 and 45.

Of the 113395 children born during the year, 58396 were boys and 54999 girls; showing that the proportion of the sexes at birth was 106·1 boys to every 100 girls—a higher proportion of boys than usual, the mean

Scottish rate being 105.5 boys to every 100 girls.

The greatest daily number of births occurred during the months of March, April, May, and June, when they averaged from 316 to 333 daily. The lowest number of births occurred during the months of August and September, when they respectively numbered 293 and 291 births daily. (Table XV.)

### DEATHS.

78789 Deaths were registered in Scotland during the year 1869, being 6403 more deaths than occurred during the previous year, and in the high proportion of 236 deaths in every ten thousand persons, or 2.36 per cent. The mean death-rate of the ten previous years was only 219 deaths in every ten thousand persons, or 2.19 per cent, so that the mortality of the year was

high above its average.

The mean English death-rate is higher than that of Scotland, being, on a ten years' average, 224 deaths annually in every ten thousand persons, or 2.24 per cent. But during the year 1869, though the death-rate was also above its average, it was not nearly to the same extent as in Scotland, seeing that it was in the proportion of 226 deaths in every ten thousand persons, or 2.26 per cent. Agencies injurious to health were therefore more prevalent in Scotland than in England during 1869.

The Town and Rural Districts of Scotland showed the usual striking

difference in the proportion of deaths. Thus, of the 75789 deaths, 50848 occurred in the Town and 24941 in the Rural Districts, giving a proportion of 285 deaths in every ten thousand persons in the Town, but only 175 deaths in a like population in the Rural Districts. (Tables V. VI. and VIII.)

The influence of density of population on the mortality was, however, most strikingly exhibited when Scotland was divided into four groups of districts according to the size of the towns in each. It then appeared that, for every ten thousand persons in each of these groups, 325 deaths occurred during the year in the Principal Towns, 276 deaths in the Large Towns, 222 deaths in the Small Towns, but only 175 deaths in the Rural Districts.

If these proportions be compared with the mean annual death-rate in the same four groups during the ten years 1856–1865, it will be seen that the increase extended over all the groups. This of itself proves that the determining cause of the increased death-rate was some general influence which acted over all Scotland, though most severely felt in those towns where the population was most crowded, and their general health enfeebled, so that they had less power to resist the deleterious agency. Thus, during the ten years 1856–1865, in every ten thousand persons in each group, there occurred the annual proportion of 282 deaths in the Principal Towns, 245 deaths in the Large Towns, 212 deaths in the Small Towns, and 169 deaths in the Rural Districts.

These are almost the exact proportions in which the deaths occurred in each of these four groups of districts in 1868; and as it is quite impossible to conceive that the sanitary condition of a whole country, and of all its Town and Rural Districts, could have so suddenly deteriorated in 1869 as to give rise to the great increase of mortality during that year, it is only reasonable to ascribe the increase to unfavourable atmospheric conditions, over which man has no control. The very circumstance of the increased mortality affecting the Rural and Small Town Districts as well as the Principal and Large Towns, infallibly leads to this conclusion, even though it is granted that the mortality will in general be proportionally highest where the health of the people is most deteriorated by overcrowding and breathing impure air.

This subject will be examined more closely when noticing the deathrate prevailing in the Eight Principal Towns of Scotland, and the diseases which were the chief agents in giving rise to the high mortality.

#### MARRIAGES.

22083 Marriages were registered in Scotland during the year 1869, being 230 more than during the previous year, but 535 fewer than during 1867, and 1605 fewer than during the year 1866. Marriages have therefore been diminishing in number since 1866, and this fact is now being seen in the diminution of the birth-rate. The mean annual marriage-rate during the ten previous years was 70 marriages in every ten thousand persons, but during the year 1869 it was at the rate of 69 marriages to the same population.

As usual, the proportion of marriages contracted in the Town Districts was very much above those in the Rural Districts. Thus, of the 22083 marriages, 14748 were contracted in the Town, and 7335 in the Rural Districts; indicating that, in every ten thousand persons in each of these, 82 marriages occurred in the Town, but only 51 marriages in the Rural Districts.

Like the births and the deaths, however, the proportion of marriages is influenced by the density of the population. Thus, when Scotland was divided into four groups, according to the size of the towns in each, it was found that, for every ten thousand persons in each group, 94 marriages were contracted in the Principal Towns, 75 marriages in the Large Towns, 63 marriages in the Small Towns, but only 51 marriages in the Rural Districts.

### EIGHT PRINCIPAL TOWNS OF SCOTLAND.

It is of great importance that the public should get as early information as possible of the birth, death, and marriage rates of those masses of the population which are collected in our Principal Towns. Weekly Reports are therefore issued every Tuesday, giving the number of births, deaths, and marriages registered during the previous week in Glasgow, Edinburgh, Dundee, Aberdeen, Paisley, Greenock, Leith, and Perth; together with the highest, lowest, and mean temperatures at each town, and the respective fall of rain.

Monthly Reports applicable to the Eight Towns are also published, and these are much more valuable, inasmuch as they not only give the mere number of the births, deaths, and marriages, but also the particulars as to the ages of the persons who have died, and the diseases which proved fatal. The public and the authorities are thus kept informed as to the outbreak or progress of every disease affecting the people, within as short a period after

the close of each month as is compatible with the due preparation of the Tables.

In the remainder of this Report there will therefore be given a summary of the births, deaths, and marriages in each of these Eight Towns during 1869. As these towns are well scattered over the country, and have a conjoint population of not much under a third of the population of Scotland, the returns from them enable us to obtain a very fair idea of the kind of diseases which are prevalent, and how far the mortality from these is influenced by local or general causes.

#### BIRTHS IN THE EIGHT TOWNS.

39515 Births were registered in the Eight Principal Towns of Scotland during the year 1869, being at the high rate of 408 births in every ten thousand persons of the population, or 4.08 per cent. This is a lower proportion than occurred during any of the four previous years, but the diminution is satisfactorily accounted for by the diminution in the number of marriages during the years 1867 and 1868. (Table IX.)

The birth-rate, however, varied much in the several towns, having been highest in Greenock and lowest in Perth. Thus, for every thousand in each of the towns, there occurred in the proportion of 30.5 births in Perth, 36.4 in Paisley, 38.0 in Edinburgh, 41.0 in Glasgow, 41.1 in Aberdeen, 43.5 in Dundee, 45.0 in Leith, but the extremely high proportion of 49.2

births in Greenock. (Table X.)

It is necessary to remark that the proportions of births, deaths, and marriages may be somewhat overrated for Greenock, seeing that there is good reason to believe that the population there during the two past years has been increasing in a more rapid ratio than is allowed for. The strikes among the shipbuilders on the Thames, and elsewhere in England, have caused almost the total transfer of the iron shipbuilding trade to the banks of the Clyde, and the consequent influx of population to Greenock and the neighbouring towns has been without a precedent. The deficient house accommodation, however, and the difficulty of procuring new sites, limit the increase of the population in the town of Greenock itself, so that it may, after all, turn out that the estimated population is not far from the truth.

Of the 39508 births in the Eight Towns, 35667 were legitimate and 3841 illegitimate, indicating that 9.7 per cent. of the births were illegiti-

mate. The proportion of illegitimate births, however, varied greatly in the several towns. (Table X.) Thus, in Greenock, only 5.4 per cent. of the births were illegitimate; in Leith, 6.5 per cent.; in Paisley, 9.4; in Glasgow, 9.7; in Perth, 9.8; in Edinburgh, 10.1; in Dundee, 11.4; and in Aber-

deen, 11.6 per cent.

Of the children born during the year, 20210 were males and 19298 females; indicating that 104.7 males were born for every 100 females, being a considerably lower proportion of boys than over all Scotland, where the proportion was 106.1 boys to every 100 girls. It has been pointed out in former Reports, that this indicates a lower tone of vitality than in the other districts of Scotland, and thus confirms the conclusions drawn from other circumstances as to the hurtful effects of density of population (or a residence in towns) on human life.

#### DEATHS IN THE EIGHT TOWNS.

31450 Deaths were registered in the Eight Towns during the year 1869, being in the very high proportion of 325 deaths in every ten thousand persons,—that is, 32·5 in every thousand, or 3·25 per cent. The average annual death-rate of the fourteen previous years was 282 deaths in every ten thousand persons,—that is, 28·2 in every thousand, or 2·82 per cent. The death-rate has therefore been excessive during the year, and the very highest which has ever been noticed since the Registration Act came into operation in 1855. During the previous year, that of 1868, the mortality was only slightly above the average; but as compared with it, the year 1869 has yielded an excess of 4938 deaths in the Eight Towns, being an increase to the extent of 18·6 per cent. in one year.

By comparing the death-rate in the several towns during each of the past eleven years (Table XI.), it will be seen that the mortality does not rise and fall in each simultaneously; and in former returns it has been pointed out that it almost always happens that different epidemic diseases take the lead in each town. During the past year, when the general mortality in the Eight Towns rose so high above the average, Aberdeen

exhibited the striking exception of having its death-rate considerably below its own average of the ten previous years; for whereas its mean annual mortality was 26·3 deaths in every thousand persons during these ten years, only 23·6 deaths occurred in a like population in 1869. In all the other towns the death-rate during 1869 exceeded the average of former years.

As usual, the death-rates in the different towns differed greatly from each other, having been lowest in Aberdeen and highest in Greenock. Thus, for every thousand persons in each town, there occurred 23.6 deaths in Aberdeen, 25.4 deaths in Perth, 29.5 deaths in Leith, 30.4 deaths in Edinburgh, 30.5 deaths in Paisley, 34.7-deaths in Glasgow, 35.1 deaths in Dundee, and 35.5 deaths in Greenock.

Of the 31450 persons who died in the Eight Towns during the year, 14070, being 44.74 per cent., were under 5 years of age; 3425, being 10.89 per cent., were between 5 and 20 years of age; 8940, being 28.43 per cent., were between 20 and 60 years of age; while 5014, being 15.94 per cent.,

were above 60 years of age. (Table XIX.)

These proportions closely correspond to the mean average of deaths at these various ages during a ten-yearly period. Thus, during the ten years 1856–1865, 45.93 per cent. of the persons who died were under 5 years of age, 10.25 per cent. were between 5 and 20 years of age, 27.78 per cent. were between 20 and 60 years of age, while 16.04 per cent. were above 60 years of age. (Table XXI.)

In our eagerness to calculate the mean probabilities of life, and the mean age at death, we are very apt to overlook the startling fact, that in our towns 46 per cent. of the deaths which occur year by year are composed

of children under 5 years of age, who know not good from evil.

To arrive, however, at an accurate knowledge of the proportional mortality of children in each town, we must compare the deaths with the living at the same ages. Table XII. shows the numbers living in each town under 5 years of age, the deaths under 5 years, and the per-

TABLE XII.—Deaths of Children under Five Years of Age in each of the Eight Principal Towns of Scotland, during the Year 1869.

Towns.	Number of Children under Five Years of Age, in 1869.	Deaths under Five Years of Age.	Per-cent. of Deaths to Population under Five Years.	Towns.	Number of Children under Five Years of Age, in 1869.	Deaths under Five Yearsof Age.	Per-eent. of Deaths to Population under Five Years.
Glasgow Edinburgh Dundee Aberdeen	$ \begin{array}{c c} 20,738 \\ 13,353 \end{array} $	7539 2156 1567 514	12·0 10·3 11·7 5·4	Paisley Greenock Leith Perth	6767 7137 5441 3406	618 831 599 247	9·1 11·6 11·0 7·2

centage of deaths to the living. By that Table it appears that Aberdeen showed the smallest proportional mortality among infants, Glasgow the highest. Thus, for every thousand living children under 5 years of age, there died during the year 54 in Aberdeen, 72 in Perth, 91 in Paisley, 103 in Edinburgh, 110 in Leith, 116 in Greenock, 117 in Dundee, and 120 in

Glasgow.

The Zymotic (epidemic and contagious) class of diseases proved fatal to 8278 persons in the Eight Towns, and thus constituted 26.6 per cent. of the mortality. This is a high proportion, but yet very little more than the average zymotic mortality of the whole town districts of Scotland during the ten years 1855–1864. During that period, 26.2 per cent. of the deaths were caused by the zymotic class of diseases. So that high though the mortality has been during 1869 above that of previous years, that single fact proves that the zymotic diseases had only increased in an equal ratio with all other diseases,—in fact, that the causes which produced the high mortality were general causes which affected nearly all classes of diseases alike.

The relative mortality, however, from the zymotic class of diseases varied very much in the several towns, depending greatly on which was the leading epidemic, and whether its type was a severe or a mild one. Thus, only 16.2 per cent. of the deaths were caused by the zymotic class of diseases in Aberdeen, 21.8 per cent. in Edinburgh, 27 per cent. in Paisley, 27.7 per cent. in Glasgow, 28.5 per cent. in Leith, 30.2 per cent. in

Greenock, 31 per cent. in Dundee, and 31.4 per cent. in Perth.

In order to point out that it is not the same epidemic which takes the lead in each town, but that the epidemic constitution, whatever it be, is under subjection to local causes, of which as yet we know nothing, we may shortly mention the epidemic diseases which prevailed and took the lead in each town.

In Glasgow, the most fatal of the epidemics was Fever, which caused 1221 deaths, being 7.89 per cent. of the deaths; after that Scarlatina, 895 deaths; then Hooping-cough, 719 deaths; and Measles, 654 deaths;—the mortality of all these being above the usual proportion.

In Edinburgh, Hooping-cough was by far the most fatal of the epidemics, causing 315 deaths, and thus constituting 5.86 per cent. of the mortality; after this came Scarlet Fever, 191 deaths; Fever, 181 deaths; and Diarrhæa, 149 deaths;—the mortality of all these being normal.

In Dundee, Scarlet Fever raged like a plague, causing 669 deaths, or the enormous proportion of 19 per cent. of the deaths; after this came Fever, which caused 140 deaths, constituting 3.97 per cent. of the deaths, or very little more than the normal mortality from that disease. All the other epidemic diseases had a mortality greatly below their average, and only two deaths from Measles occurred during the year.

The fact of one epidemic disease of children, when it rages as a virulent epidemic, taking the place of the others, and throwing them into abeyance, has been frequently remarked in Scotland, and the above is one of the most striking instances which has occurred since the Registration Act came

into operation.

In Aberdeen, Fever was by far the most fatal of the epidemics, causing 113 deaths, or 6.40 per cent. of the mortality, being considerably above the town proportion of Fever deaths. Diarrhœa was the next most fatal of the epidemics; but it only caused 44 deaths, or 2.49 per cent. of the mortality. The deaths from Measles, Scarlatina, Diphtheria, and Hooping-cough were very few, and very far below their usual average.

In Paisley, Hooping-cough was the most fatal of the epidemics, causing 128 deaths, or 8.98 per cent. of the mortality; after this came Scarlatina, 86 deaths, being 6.03 per cent. of the mortality, or a third above the normal town average; then followed Fever, 75 deaths, being 5.26 per cent. of the mortality—slightly above the average. The mortality of all the other epidemic diseases was greatly under the average.

In Greenock, Scarlet Fever was the most fatal of the epidemics, causing 150 deaths, or 8.99 per cent. of the mortality—just twice the usual per-centage of that disease. Next followed Fever, causing 101 deaths, or 6.05 per cent. of the mortality; then Diarrhæa, causing 71 deaths, or 4.25 per cent. of the mortality. The mortality of Hooping-cough and Measles was slightly below the average; but Small-pox prevailed to an unusual

extent, causing 37 deaths, or 2.22 per cent. of the mortality.

In Leith, Scarlet Fever was by far the most fatal of the epidemics, causing 94 deaths, or 8.09 per cent. of the mortality. Measles caused 62 deaths, being 5.34 per. cent. of the mortality; and Hooping-cough 57 deaths, or 4.91 per cent. of the deaths. All the usual epidemics of children were therefore unusually prevalent in Leith, but the other epidemics were not more fatal than usual.

In Perth, as in Dundee, Scarlatina raged like a pestilence, cutting off 157 persons, and thus constituting the enormously high proportion of 22.82 per cent. of the deaths. To make up for this, the other epidemics of children were in abeyance, so that there were no deaths from Small-pox or Measles,

only one from Diphtheria, seven from Hooping-cough, and twelve from Croup. Even Diarrhæa and Fever were far less prevalent than usual.

It is only of late years that British physicians have recognised the different forms of Continued Fever, so as to be able to distinguish them; and when they were suddenly startled many years ago with an outbreak of Fever, the leading type of which was the Relapsing, they originated the theory that Fevers were changing their type. For at least a century and a half epidemics of Fever have prevailed over the country, which were sometimes characterized by the majority of the cases being Typhus, at other times Enteric, and at other times Relapsing Fever; but in numerous instances it occurred that all the three forms co-existed in the same epidemic. During 1869, of the 1221 deaths from Fever in the Eight Towns, 948 were from Typhus, 221 from Enteric, 12 from Relapsing, 9 from Simple Continued, and 31 from Infantile Fever, which is a mere variety of Enteric, if indeed it be a variety. It is thus seen that all the various types of Fever are to be met with among the population, and the unknown atmospheric agencies which lead to the outbreak of Fever may cause any one of these at any time to take the lead. In most of the Towns, Typhus was the prevalent form of Fever during 1869; but in Leith, nearly twice as many deaths occurred from Enteric as from Typhus Fever.

Of Diseases of Uncertain Seat in the Eight Towns, Cancer caused 434 deaths, and undefined Dropsy 371. It is somewhat remarkable, that year after year, Edinburgh and Aberdeen seem to furnish twice the proportion of

Table XIV.—Per-centage of Deaths from different Diseases to the Total Deaths in each of the Eight Principal Towns of Scotland during the Year 1869, allowing for the causes not specified.

deaths by Cancer that other towns do. It would be interesting to inquire

into the probable cause of this.

The Tubercular Class of Diseases caused 5117 deaths in the Eight Towns, and thus constituted 16.47 per cent. of the deaths, or caused 53 deaths in every ten thousand persons of the population. This, as compared with the deaths, is a lower proportion than usual; but as compared with the population, it is a higher proportion than usual. This fact shows that though the actual number of deaths from this class of diseases was higher than usual, yet the increase was not proportional to the increase of the deaths from all other causes. In other words, the above facts showed that the cause (whatever it was—call it atmospheric) which gave rise to the increased mortality in 1869, though it also increased the deaths from the tubercular affections, did not increase them to the same extent as it increased the deaths from other causes. This is, in fact, only giving an instance of what has been again and again observed with regard to the diseases classed under this head, that their mortality from year to year is more steady than that of most other diseases, and that they are less liable to those extreme fluctuations to which the zymotic diseases and the inflammatory affections of the respiratory organs are liable.

Of the diseases belonging to this class, Consumption or Phthisis was the most fatal, causing 3572 deaths in the Eight Towns, or 11.49 per cent. of the mortality. The proportion of deaths from Consumption in the several towns was very different. Thus, only 7.15 per cent. of the deaths were from Consumption in Leith, 8.86 per cent. of the deaths in Perth, 10.17 per cent. in Edinburgh, 11.37 in Paisley, 11.71 in Glasgow, 12.39 in Dundee, 13.49 in Greenock, and 13.94 in Aberdeen. The very circumstance of Aberdeen showing such a high proportion of deaths from Consumption, as compared with the total deaths, is a good example of the truth of the above remarks relative to the greater steadiness from year to year of the deaths from the tubercular diseases. In Aberdeen the general mortality was below the average of former years, and the deaths from Consumption in 1869 were also below the mean, but not so much as the other diseases. Therefore, though the actual deaths from Consumption were 17 fewer in number than during the previous year, the relative proportion of deaths from that disease was 13.94 per cent. of the deaths in 1869, but only 12.64

per cent. in 1868.

When the deaths from Consumption in the Eight Towns are compared with the population, Leith would appear to be the town least liable to that complaint, Greenock the most liable. Thus, for every ten thousand persons in each town, there died from Consumption during the year, 21 in Leith, 22 in Perth, 30 in Edinburgh, 32 in Aberdeen, 34 in Paisley, 40 in Glasgow,

43 in Dundee, and 48 in Greenock.

Of the other tubercular diseases, Hydrocephalus caused 944 deaths,

Tabes Mesenterica 390, and Scrofula 211.

Diseases of the Brain and Nervous System caused 2450 deaths in the Eight Towns, and thus constituted 7.88 per cent. of the mortality, or caused 26 deaths during the year in every ten thousand persons. The mortality from the brain diseases was very different in the several towns. Thus they constituted 6.41 per cent. of the deaths in Greenock, 6.93 per cent. of the deaths in Glasgow, 6.96 per cent. in Dundee, 8.01 per cent. in Leith, 9.01 per cent. in Perth, 9.40 per cent. in Paisley, 10.12 per cent. in Edinburgh, and 10.88 per cent. of the deaths in Aberdeen. As compared with the population, for every ten thousand persons in each town, there died from

brain disease 22.0 in Perth, 22.8 in Greenock, 23.9 in Leith, 24.1 in Glasgow, 24.5 in Dundee, 25.7 in Aberdeen, 28.7 in Paisley, and 30.7 in Edinburgh.

Diseases of the Heart and Organs of the Circulation caused 1209 deaths, thus constituting 3.89 per cent. of the deaths, or 12.6 deaths in every ten thousand persons. The proportion of deaths from Heart Disease was highest in Edinburgh and Perth, lowest in Paisley and Glasgow. Thus, only 2.38 per cent. of the deaths were caused by Heart Disease in Paisley, 2.83 per cent. in Glasgow, 3.83 per cent. in Dundee, 4.05 per cent. in Leith, 4.92 per cent. in Greenock, 5.50 per cent. in Aberdeen, 6.16 per cent. in Edinburgh, and 6.39 per cent. in Perth. As compared with the population, the mortality from Heart Diseases was lowest in Paisley and highest in Edin-

burgh.

Inflammatory Affections of the Respiratory Organs caused 6198 deaths, being an increase of 1587 deaths, or 34.4 per cent., from this cause alone over those of the previous year. They thus constituted the very high proportion of 19.95 per cent. of the deaths, or caused 64.8 deaths in every ten thousand persons. The average town proportion is only 15.05 per cent. of the deaths, or 40.7 deaths in every ten thousand persons, so that it is at once apparent how very great has been the increase on this class of diseases during the past year. It is acknowledged by all that this class of diseases is almost entirely under the influence of atmospheric agencies. They regularly diminish in prevalence with the advance of mild weather, and as regularly increase with the decrease of temperature, or with the blowing of cold northerly or easterly winds. As nearly half of the increased mortality of the year was therefore caused by these diseases—that is, was caused by atmospheric influences—and as these same atmospheric agencies have again and again been proved to increase the mortality from all diseases, we have a perfectly satisfactory reason for the increased mortality which prevailed in our towns during 1869, without requiring to assume that their sanitary condition had suddenly deteriorated to the extent of 18.6 per cent.

The deaths from inflammatory affections of the respiratory organs was lowest in Perth, highest in Glasgow. Thus, for every ten thousand persons in each town, there occurred 29 deaths in Perth, 39 in Paisley and in Aberdeen, 52 in Greenock and in Leith, 58 in Edinburgh and in Dundee, and 79 in Glasgow. Or, if compared with the total deaths, 11.62 per cent. of the deaths were caused by that class of diseases in Perth, 12.91 per cent. in Paisley, 14.64 per cent. in Greenock, 16.72 per cent. in Aberdeen, 16.76 per cent. in Dundee, 17.57 per cent. in Leith, 19.37 per cent. in Edinburgh, and 23.01 per cent. in Glasgow. The mortality from that class of diseases was therefore excessive in Glasgow, and very high in Edinburgh, Dundee,

Leith, and Greenock.

Of the various diseases belonging to this class, Bronchitis caused 4381 deaths in the Eight Towns, Pneumonia 1285, undefined Disease of Lungs 249, Asthma 197, Pleurisy 79, and Laryngitis 57.

Diseases of the Organs of Digestion caused 2003 deaths in the Eight Towns, thus constituting 6.44 per cent. of the mortality, or 20.8 deaths in

every ten thousand of the population.

Of the other classes of disease, Diseases of the Urinary Organs caused 367 deaths; Childbirth and Diseases of the Generative Organs, 272 deaths; Rheumatism and Diseases of Joints and Bones, 162 deaths; Skin Diseases, 32 deaths; Malformations, 56 deaths; Debility and Premature Birth, 1428 deaths; Old Age, 1263 deaths; Sudden, 106 deaths.

Including the cases of Metria, or Childbed Fever, 265 mothers died in

giving birth to 39515 children, showing that one mother died for every 149 children born alive.

946 deaths were ascribed to violent causes in the Eight Towns, thus constituting 3.04 per cent. of the deaths, or 9.9 deaths in every ten thousand persons. It is a very remarkable fact, explain it how we will, that in general the deaths from accident rise and fall with the deaths from disease. Thus, during 1869, the increase on the total deaths over the previous year was 18.6 per cent.; and it cannot fail to strike every one with surprise, to find that the increase on the accidental or violent deaths was to the extent of 15.6 per cent.

In proportion to the population, Greenock and Leith, and then Glasgow, had the highest mortality from violent deaths; Paisley and Perth the lowest. 371 deaths resulted from fractures and contusions, 146 from drowning, 85 from burns and scalds, 63 from suffocation, 22 from hanging, 78 from want of breast milk, 54 from intemperance, 4 from privation of food, 3 from exposure to cold, 13 from poison, 5 from poisoned wounds, 7 from gunshot wounds, 15 from cuts and stabs, and 70 from other violent causes not included in the above.

Of the 946 violent deaths, 45 were suicides, and one a murder.

### MARRIAGES IN THE EIGHT TOWNS.

9161 Marriages were registered in the Eight Towns during 1869, being 555 more marriages than during the previous year, or an increase by 6.4 per cent. This indicates the high marriage-rate of 94 marriages in every ten thousand persons, that of the previous year being only 90 marriages in a like population.

The proportion of marriages in the several towns was lowest in Perth, and highest in Leith. Thus, for every ten thousand persons in each town, there occurred 80 marriages in Perth, 86 in Paisley, 90 in Dundee and Aberdeen, 93 in Glasgow, 98 in Edinburgh, 108 in Greenock, and 109 in

Leith.

### WEATHER AND ITS INFLUENCE ON THE MORTALITY.

It may now be regarded as an established fact, that in Scotland the weather is the agent which exerts the most powerful influence on the mor-

tality. During few seasons does the temperature of the warmer months rise so high as to induce an increased mortality. Hence, in Scotland, the more genial months are those which are most healthy. In all countries, however, where the mean temperature of the summer or autumnal months rises above 60°, the greatest mortality occurs during these warm months; and hence it happens that, even in Scotland, when the temperature rises higher than usual, an increase in the deaths is observed, and that increase is caused by the same class of diseases (viz. bowel-complaints) which induce the high mortality during the hot months of warmer regions.

In Scotland it is the cold which is the chief agent in increasing and regulating the deaths; but the cold exerts its deleterious action under two forms—1st, through mere lowness of temperature; and, 2d, through the agency of cold northerly or easterly winds. As a general rule, the coldest months are also the most fatal; but if, with a low temperature, the keen, arid northerly or easterly winds blow with anything like severity, the mor-

tality becomes as high as if a pestilence were raging.

The influence of these combined deleterious atmospheric agencies in increasing the mortality was strikingly illustrated during 1869, which showed itself, in more ways than one, to be a year characterized by its exceptional

meteorological phenomena.

Thus, taking a ten years' average, January and February are the coldest months, averaging respectively 37°·1 and 37°·4 of mean temperature; after which follows December, with a mean temperature of 38°·6, and March, with a mean temperature of 39°·8. But the year 1869 was of such an exceptional and severe character, that the coldest month of the year was December, when the mean temperature was only 34°·9; while March was the second coldest month, its mean temperature being only 37°·8, or 4°·1

below that of February—a strikingly unusual occurrence.

It has been long observed that, when the cold weather first sets in, it does not prove so fatal to the general population as it does later in the winter, the greater amount of vitality in the people somewhat resisting the depressing effect of the cold at the early part of the season; whereas, when severe cold occurs towards the end of winter, the constitutions of the people having been already weakened by its continuance, the deaths increase to a most alarming extent. This was strikingly illustrated during the past year. The coldest month was December, and it produced 7432 deaths. March, however, though nearly three degrees of temperature warmer, found the people weakened by the long continuance of the cold, and produced 7640 deaths. Had these two months been each of their average temperatures, the deaths during December would only have amounted to 5928, and the deaths in March to 6326. The extraordinary severity of the weather, therefore, during these two months alone caused an increase of 2820 deaths more than would have occurred had the weather maintained its usual character. Even if we compared the mortality of these months with that of the previous year, 1868, which was in many respects near a year of mean mortality, we shall find that the year 1869 yielded an excess of 2436 deaths for these two months.

January and February 1869 were unusually mild months, the prevalent winds being from the south-west and west, with less northerly or easterly winds than had occurred for years; and the consequence was, that there was no truly wintry weather during either of these months till the last week of February. The mean temperature of January was therefore 40.4, and that of February 41.9, and the deaths registered in Scotland were 6619 in January, and 6172 in February,—averaging 213 deaths daily during Janu-

ary, and 220 daily during February. This slight increase of the deaths during February from the mere continuance of the cold weather, even though its mean temperature may rise a degree or two above that of Jan-

uary, is observed year after year. (Table XVI.)

Very different kind of weather prevailed during March. On the 27th February the wind veered to the north and north-west, and the whole of Scotland was immediately covered with snow; the frost was often severe; and during the whole month of March the winds blew with biting severity from the north, occasionally varying slightly to the north-west and north-east. The pernicious effects of these cold withering winds was instantly marked on the health of the people. Every disease increased in virulence and fatality, especially those of the respiratory organs, and the various epidemics which prevailed in different parts of the country, so that the deaths in Scotland rose to 7640 during March, or to 246 deaths daily—the highest proportion attained during the year.

April, as to weather, was an average month, with a mean temperature of 46°9, which is rather above the average of former years; but so many had been seriously affected by the cold weather of the previous month, and died during this one, that the deaths in April numbered 6650, or were at

the rate of 222 deaths daily.

During both May and June the mean temperature was considerably below the mean, apparently produced by the unusual prevalence and severity

Table XVI.—Meteorology of Scotland for the Year 1869, deduced from observations made at 55 Stations of the Meteorological Society of Scotland, the particulars for each of the Stations having been published in the Quarterly Reports of the Registrar-General for 1869; also, the Number of Births, Deaths, and Marriages registered during each Month of the Year 1869.

<sup>\*</sup> As few or no Marriages are contracted in Scotland on Saturday or Sunday, these days are excluded from each month in calculating the daily number of Marriages.

Report:

of the northerly winds, which not only blew with a constancy rarely witnessed in Scotland, but with such keenness that, on the 15th, 16th, and 17th of June, the whole of the high ranges of hills in Scotland were covered with snow. The consequence was that, instead of June being one of the months whose mortality was below the mean, it had, with May, a high mortality—nay, a higher mortality than May itself; for May had 207 deaths daily, while June had 212 daily. In fact, these two months had an excess of 1625 deaths above those of the corresponding months of the previous year, and the different state of the weather during the corresponding months of the two years sufficiently accounted for the difference.

July was the warmest month of the year, its mean temperature reaching 59°·3. It was also a month of great drought, and it has been invariably remarked that such kind of weather is attended with much sickness. Accordingly, 5848 deaths were registered during the month, being at the

rate of 189 deaths daily.

August was also characterized by its extreme drought, and its mean temperature was below the average, being only 56°·1. The alternations of temperature were also often great. The mortality was therefore at the rate

of 174 deaths daily.

As a general rule, September is the month of least mortality in Scotland, after which comes August, and then October. But during 1869 all this was reversed. August proved to be the month of least mortality, after which came October, while September was the third. This fact, of itself,

proved what an exceptional year 1869 was.

The mean temperature during September was 51°·2, which was below the average of previous years; but the drought which had lasted for two months came to a sudden termination, and September proved a very rainy month, scarcely a day passing without a shower, and the quantity of water which fell was a half more than the average of former years. Under this great change of weather the health of the people did not improve, so that the daily deaths numbered 176, or two more daily than during the previous month.

During October the mean temperature was the average of former years, being 47°·3; but there was an unusual amount of north and north-west winds, and snow covered the hills from the 14th of the month. The deaths, therefore, still remained high, though not quite so much so as during September, seeing that 175 persons died daily over Scotland.

During November the weather was very much as usual, with a mean temperature of 40°.4; and the deaths, as usual, increased with the fall of

temperature, so that 217 deaths occurred daily.

During December the weather proved much colder than usual, its mean temperature being 3°·7 below the average of former years. Dry frost prevailed during most of the month, accompanied by cutting northerly, north-easterly, and north-westerly winds; and under this ungenial weather sickness prevailed to an extent seldom witnessed in Scotland, affections of the respiratory organs being nearly universal. The deaths consequently rose to 7432 during the month, being at the high rate of 240 deaths daily.

These striking facts prove how closely our health and lives are dependent on the kind of weather which prevails. In interpreting these meteorological conditions, and showing how they act deleteriously on the human race, it must be remembered that their influence for evil depends on the state of health of the community whose case we may be considering. The lower the state of health, the more powerfully do these adverse meteoro-

logical agencies act on the person. This is the reason why these agencies exert so much more deadly an influence over the population of our overcrowded towns, than over those in our small towns and in the rural districts. Just in proportion to the overcrowding and the breathing of vitiated air, is the general health of the people deteriorated; so that when any cause comes which induces or increases disease, the inhabitants of the overcrowded town fall a prey to disease to a much greater extent than they do in towns where the population is more widely spread, and where the air breathed is conse-

quently purer.

Our Monthly Reports of the diseases causing deaths in the Eight Towns of Scotland, enable us to trace the influence of weather on each of the diseases which afflict our race. On no class of diseases was this influence seen more strikingly during the last year than on the inflammatory affections of the respiratory organs. Thus, during September, only 229 died from these diseases; but as the temperature fell, and the northerly winds got more keen, the deaths from these diseases increased to 287 in October, to 567 in November, and to 903 in December. Brain diseases only proved fatal to 150 persons in September, but to 260 in December. Heart diseases only cut off 72 persons in October, but 126 in November, and 111 in It is a recognised fact that Consumption is always most fatal December. when the northerly or easterly winds blow with severity in spring; but in 1869 the fatality was much greater than usual in March and May, under the exceptional keenness of the north winds; for while only 225 died from Consumption in October, and 300 in January, no fewer than 408 were cut off in March, and 391 in May. Fever, which caused only 115 deaths in January, caused 189 in March; and though only 118 died from that disease in September, 193 deaths were caused by it in December. caused 114 deaths in July, but 333 in November. Hooping-cough, which caused 61 deaths in September, caused 145 in December. (Table XVII.) The most instructive Table, however, as to the influence of the weather,

but especially of mean temperature, on the mortality, is that which shows the weekly deaths, alongside of the highest, lowest, and mean temperatures, and the rainfall during each week of the year 1869. (Table XVIII.) reading that Table, however, it is necessary to remember, that if the extreme cold occurred at the end of a week, the deaths caused by that cold will be found in next week's register; whereas, when the extreme cold occurred at the beginning of the week, the registrations during that week express very accurately the influence of that depression of temperature on the deaths. One or two examples may be quoted. During the weeks ending 13th and 20th February, the mean temperature was 43°·2, and the weekly deaths numbered respectively 611 and 595; but the mean temperature fell to 36°.4 and 38°.4 on the weeks ending 13th and 20th March, and the deaths rose to 700 and 747 weekly; and even when the temperature rose to 40° and to 41° during the two following weeks, being still a lower temperature than during February, the deaths continued at the high rate of 727 and 716 weekly. During the week ending November 6th, with the mean temperature of 45°·3, there were registered 586 deaths; but during the week ending 4th December, the mean temperature was 31°·3 only, and the deaths registered numbered 642; but as the greatest cold occurred on the Thursday night, it was not till the following week that the full effect of the reduction of temperature was seen upon the deaths, when, though the temperature was higher, viz. 36°.9, there were registered 753 deaths, and 751 on the week following.

It is a very interesting and important inquiry, to trace the influence of season and atmospheric vicissitudes on the mortality at different ages. From the want of facts, the most vague theories prevail, and it is with the view of furnishing facts on this subject that Tables XIX. to XXII. have been

drawn up. These Tables must be read horizontally, or perpendicularly, according to the kind of information we wish to obtain from them; and the

facts are confined to the Eight Principal Towns.

Let us first look at the influence of season on the deaths at each of the four periods of life noted in the Tables. For this purpose we must read the columns perpendicularly, and confine our attention to the corrected deaths given in Table XX.; but it must be remembered that the conclusions deducible therefrom are alone applicable to the year 1869, as they differ considerably from those deduced from a ten years' summary of the same class of facts.

For children under 5 years it will be seen that the lowest mortality occurred in the month of September, 946 deaths having only occurred among such during that month. The next most healthy months were August and October, when 1005 deaths respectively occurred. July was the next most healthy month, 1132 deaths only having occurred; and it was with extreme surprise that it was found that January was the fifth most healthy month for children under 5 years of age, 1183 deaths having occurred.

The most fatal month for children under 5 years during 1869 was March, when 1455 deaths occurred. Then followed December, with 1367

YEAR	14,345	3484	9116	5113	32,058	12,000

deaths; November, with 1278 deaths; February, with 1271 deaths; April, with 1263 deaths; May, with 1224 deaths; and June, with 1216 deaths.

1869, however, was an exceptional year, and the proportional average fatality of each month to children under 5 years of age can only be obtained by taking the average of a number of years. Tables XXI. and XXII. give

the facts for the ten years 1856-1865.

The first column of Table XXII. shows that during these ten years the month of least mortality to children under 5 years of age was September, when 8649 deaths occurred. Then followed June, with its 8675 deaths; August, with its 8889 deaths; July, with its 9052 deaths; May, with its 9058 deaths; October, with its 9078 deaths; and April, with its 9929 deaths.

During these ten years the month most fatal to children under 5 years of age was February, when 11165 deaths occurred. Then followed January, with 11066 deaths; December, with 10590 deaths; November,

with 10458 deaths; and March, with 10359 deaths.

These facts show how very exceptional the weather and the mortality were in 1869. For while during a ten yearly period February was the most fatal month to children under 5, and March was only the fifth fatal month; during 1869 March was the most fatal month, while February only came fourth.

36

It is a remarkable fact, that in ordinary seasons there is less variation in the monthly mortality of persons between the ages of 5 and 20 years than at any other period of life. Thus, by the ten-yearly Table, second column, it will be seen that, though the months of least mortality were in order, August, September, October, July, and June, and the most fatal months in order, February, January, March, December, May, and April, the difference was not nearly so great as at the earlier years of life.

During 1869, however, the normal rule was departed from, and two of the months generally least fatal to persons between 5 and 20 years of age became fatal months. Thus, during 1869, the most fatal months to persons from 5 to 20 years of age were in order—June, 336 deaths; November, 316 deaths; March and December, each with 312 deaths; and September, with 305 deaths. The least fatal months to persons at these ages were February, with 213 deaths; August, with 258 deaths; July, 278 deaths; May, with 283 deaths; April, with 289 deaths; January and October, each with 291 deaths.

Thus, again, the exceptional character of the year 1869 was manifested; for while on the average of years June has six months more fatal than itself to persons between 5 and 20 years of age, in 1869 it was the most

fatal month of the whole year.

On a ten years' average to persons between the ages of 20 and 60 years—the vigorous period of life—September was the month of least fatality; after which came in order, October, August, July, June, and November. And while January proved the most fatal month, there followed in order, February, March, December, May, and April.

During 1869, however, October proved the month of least fatality to persons from 20 to 60 years of age; after which followed in order, September, August, July, January, and June. The most fatal month to persons at that age was March; after which followed in order, December, November,

February, April, and May.

The exceptional character of the year 1869 was therefore also strongly shown at this period of life, inasmuch as March, which in general is the third of the most fatal months to persons between 20 and 60 years of age, proved the most fatal in 1869, while December, which is usually the fourth most

fatal month, became the second.

The hurtful effects of cold on persons above 60 years of age is strikingly exemplified in the fourth column of Table XXII. Thus, in a ten years' period, the most fatal month was January, with its 4837 deaths; and then February, with 4165 deaths; December, with 3893 deaths; March, with 3865 deaths; April, with 3746 deaths; and November, with 3668 deaths. The least fatal months to persons at this advanced age were September, with only 2536 deaths; October, 2679 deaths; August, 2698 deaths; July, 2886 deaths; May, 3180 deaths; and June, 3215 deaths.

During 1869, however, an exceptional mortality occurred. The most fatal month to persons above 60 years of age was December, when 583 deaths occurred; then followed in order, March, 543 deaths; January 504 deaths; February, 477 deaths; April, 464 deaths; and November, 463 deaths. The least fatal months to persons at the advanced ages during 1869, were in order, September, 309 deaths; October, 313 deaths; August, 314 deaths;

July, 328 deaths; May, 371 deaths; and June, 444 deaths.

We thus again see the exceptional nature of the mortality during 1869, and its dependence on the kind of weather which prevailed; for while, in ordinary years, to persons above 60 years of age, three months precede March in fatality, only one month had a higher mortality during 1869.

Report.

When these Tables are read horizontally, they show the relative effect which season has on the mortality at each several age. It will be seen that the effect of season on the mortality at each period of life, in so far as regards the proportions in which the population is cut off at each age, does not differ so much as might have been expected,—that, in fact, increase of heat or of cold, however potent in increasing or diminishing the mortality, does not greatly alter the proportion which the deaths at the different ages hold to each other. In pointing out the influence of season on the mortality at each age, it was shown that that influence was less powerfully shown between the ages of 5 and 20 years than at any other. In other words, that the mortality at that period of life was less affected by the monthly vicissitudes than that at all other periods of life. Hence, when we compare the proportions dying at each age during each month, we find that during the healthiest months, when the mortality at every age is lowest, the relative proportion of those who died between the ages of 5 and 20 years seems to be at its highest. This is exactly what it ought to be. As the deaths at that age vary less during each month than do the other deaths, their relative proportion seems somewhat higher during the healthier months.

Taking the whole ten years, however, these Tables show, that of every hundred persons who died in the Principal Towns during that period, 45.93 were under 5 years of age, 10.25 were between 5 and 20 years, 27.78 were between 20 and 60 years, while 16.04 were above 60 years of age.

between 20 and 60 years, while 16.04 were above 60 years of age.

# VACCINATION IN SCOTLAND, 1868.

This is the Fifth Report relative to the vaccination of children in Scotland, and it shows what proportion of the children whose births were registered during the year 1868 were vaccinated according to the provisions of the Scottish Vaccination Act, 26 and 27 Vict. c. 108. By the provisions of that Act, a large proportion of the children born during 1868 must be vaccinated during the year 1869. The Report, therefore, having reference to vaccination, must always be one year behind that having reference to the births, deaths, and marriages.

From the vaccination returns just received, it appears that, of the 115621 children whose births were entered on the registers during the year 1868, 102140, being 88:340 per cent., were successfully vaccinated; 914, or 0.791 per cent., had their vaccination postponed from bad health or other

Table XXIII.—Deaths from Small-pox in Scotland, 1855-1869 inclusive.

<sup>\*</sup> Estimated from the ascertained Small-pox Deaths in the Eight Principal Towns of Scotland, as compared with the total Small-pox Deaths in all Scotland during the Ten Years 1855-1864.

causes; 514, being 0.444 per cent., were found to be insusceptible of vaccination—277 from constitutional insusceptibility, 7 from having had Smallpox, and 230 from having been previously vaccinated; 9440, being 8.165 per cent., died before they could be vaccinated; while 2613, being 2.260 per cent., had removed from the district before vaccination could be enforced, or were otherwise unaccounted for. (Table XXIV.)

The fact, however, which we wish to learn is, what proportion of the children who survived the age when they could be vaccinated are protected from the ravages of Small-pox by vaccination. Table XXV. is drawn up with the view of showing this fact, both for the year 1868 and also for the previous years during which the Vaccination Act has been in operation.

By that Table we learn that, of the surviving children of 1868, no fewer than 96·194 per cent. were successfully vaccinated; that 0·861 per cent. had their vaccination postponed from bad health or other causes; that 0·484 per cent. were insusceptible of vaccination; while 2·461 per cent. had removed from the district before vaccination could be enforced, or were otherwise unaccounted for. It is this latter class who are alone dangerous to the community, as, from not being protected by vaccination, they are liable to Small-pox, while the migratory habits of their parents make them

1866	Per-centage	\$8:286	0.510	0·292	0·026	0·200	\$.294	2·392	100·000
1867	Per-centage	\$8:578	0.587	0·204	0·014	0·132	\$.193	2·292	100·000
1868	Per-centage	\$8:340	0.791	0·240	0·005	0·199	\$.165	2·260	100·000

<sup>\*</sup> The slight discrepancy between the number of Births as here given and those published in the Annual Reports of the Registrar-General, arises from the circumstance that some of the Registrars have included the transcript Births, and this unduly increases the proportion of those who appear to escape vaccination.

more dangerous to the community than any other class, seeing they are the fruitful means of introducing Small-pox into the otherwise healthy towns or

districts which they frequent.

Small-pox, like every epidemic disease, has its periods of prevalence and of decline; and hitherto we have refrained from attributing the noted decline of Small-pox in Scotland to the successful working of the Vaccination Act, lest, after all, it should prove that the decline arose alone from the past years being those when Small-pox would of itself have been in abeyance. As Table XXIII. will show, during the first year when the Vaccination Act came into operation Small-pox was epidemic in Scotland, and caused the large number of 1741 deaths. At no former period of which we have any certain records, has an epidemic of Small-pox been longer absent from the people than three years; but since 1864 the number of cases of Small-pox has been gradually becoming fewer and fewer, so that in 1868 only 25 deaths occurred, and during the present year they cannot have exceeded 100 over all Scotland—a very large proportion of these having occurred in Greenock among those unprotected by vaccination.

Seeing, therefore, that for a period of five years Scotland has had no epidemic of Small-pox, and at no former period of which we have certain records has the mortality from Small-pox been so low, it seems only reasonable to infer that it is the successful working of the Vaccination Act which

has produced this desirable result.

Many of the Registrars have appended notes to their returns relative to the working of the Vaccination Act, and extracts from several of these are given in the Appendix. These notes, while they agree with those given in former Reports in showing that the Act in general works successfully, also seem to demonstrate that some amendments are required to make it work more smoothly and more effectually over the country, and also for the purpose of removing certain decided hardships and the great risk to life to which the inhabitants of the Insular Districts are exposed when they endeavour to comply with the requirements of the present Act. As these suggested amendments have been commented on at length in former Reports, we simply make reference to them here lest their existence should be overlooked.

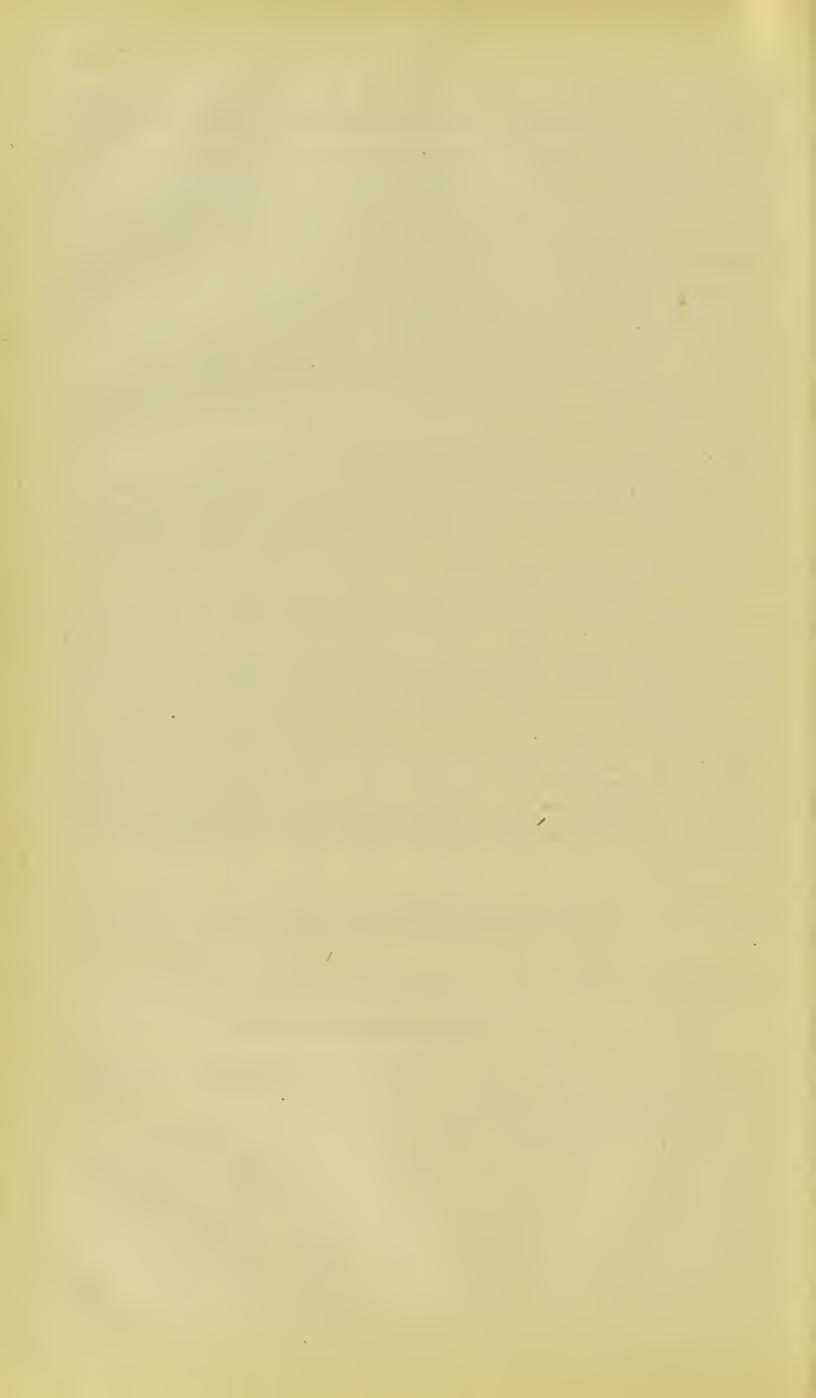

I have the honour to be,

SIR,

Your most obedient Servant,

JAMES STARK.

GENERAL REGISTRY OFFICE OF BIRTHS, ETC., EDINBURGH, 8th March 1870.

	1869.			JANUARY,	FEBRUARY,	MARCH,	APRIL,	MAY,	JUNE,	JULY,	AUGUST,	SEPTEMBER,	OCTOBER,	NOVEMBER,	DECEMBER,	YEAR, .

The absolute highest temperature, viz. 81°.5, was noted at Aberdeen in August; and the absolute lowest, viz. 13°.0, at Glasgow in December.

Norg.-The figures under each month are the mean results from the eight Stations, as published in the Monthly Returns.

Registered during 1869 in the Town and Landward portions respectively of all the Burghal Districts of Scotland (with the exception of the Eight Principal Towns), and of all the other Districts embracing Towns with a population of 2000 and upwards at the Census of 1861.

(In a few cases the columns headed 'Town (or Burgh)' include the events occurring in adjoining villages; while in some instances the figures pertaining to the 'Landward' portion of the Districts embrace those occurring in one or more small Towns. In four or five cases, where a Town or Burgh happens to extend to two Registration Districts, the Births, etc., pertaining to the entire Town or Burgh' are collectively stated.)

\* Springburn.—Thirteen of the fourteen Illegitimate Births, and 394 of the 432 Deaths, in the Landward District, took place in Barnhill Poorhouse.

† Dalziel.—Five of the eleven Illegitimate Births in the Town District took place in Motherwell Poorhouse, the mothers belonging to other parishes.

† Partick.—Eighty of the 152 Deaths in the Landward District occurred in the Gartnavel Lunatic Asylum.

# APPENDIX.

## EXTRACTS FROM THE REGISTRARS' NOTES RELATIVE TO THE WORKING OF THE VACCINATION ACT.

### I. NORTHERN DIVISION.

### 1. SHETLAND.

3. (2.) SANDWICK AND CUNNINGSBURGH .- Of the 66 births registered during 1868, there are still twelve unaecounted for, although it is quite possible they may have been vaccinated; but from some of the parents not having money at the time to pay the vaccinator's fee, they do not get delivery of the certificate. In some cases the certificate has not been handed in until nearly a year after the operation has been performed.

4. (1.) Fetlar.—The same drawbacks that have been noticed in former returns still exist. It is not without eause the poor parents complain loudly of being under the necessity of exposing their infants to the risk of being carried not only miles of land road, but also across dangerous sounds to a distant island. In many eases the health of the mother is seriously

injured.

12. (3.) PAPA-STOUR.—Vaccination has been more regularly attended to for the year 1868, than during previous years. One great barrier to the working of the Aet here is, the poverty of the people. Out of 23 cases of vaccination, on one oceasion 20 of the parties had to borrow the money to pay the vaccinator, and in several cases could not obtain it. I have before recommended a system of parish assessment for the purpose, when vaccination, the same as registration, would go on regularly without murmur or delay.

### 2. Orkner.

17. FIRTH AND STENNES. - The Act is well attended to, but costs the Registrar as much trouble as the Registration Act does, consequently the remuneration is far from adequate.

29. SOUTH RONALDSHAY. - The Act works well, and the people seem willing to have their

ehildren vaecinated.

30. STROMNESS .- The Act is strictly attended to, and works smoothly.

### II.—NORTH-WESTERN DIVISION.

5. Ross and Cromarty.

Mainland.

66. (1.) NORTHERN DISTRICT OF GAIRLOCH. -The cause of the five not being vaccinated is, that the vaccinator has been confined for six weeks by typhus fever, and no other person has

been appointed in his place.
66. (2.) SOUTHERN DISTRICT OF GAIRLOCH. -The operation of the Act is still very irregular. The people are become indifferent as to the time of sending in the certificates, one of which was received on 3d January 1870, the child for which it was granted being then 21 months old, and this notwithstanding that the time was prolonged from six to twelve months. The parents of the seven children marked in col. 7 rest their defence on the vaccinator's illness, he being confined for some time back, and still lies dangerously ill; no other vaccinator being nearer than Ullapool, which is from 30 to 50 miles distant from some parts of this parish. Unless the Parochial Board takes action, and uses more stringent measures against defaulters, the Act will soon become a dead letter in Gairloeh.

74. Lochalsh.—There is no improvement in the working of the Act—indeed, quite the reverse, as the large number of entries (12) for whom no eertificates have as yet been received fully testifies. It is not for me to say how this happens; I merely state the fact, and leave those most

concerned to account for it.

75. Lochbroom.—The Act is much better attended to now than formerly. The vaccinator endeavours to do his duty willingly and faithfully, and the docile inhabitants are doing their best; but in such a wide and wild parish, many difficulties will occur to prevent punctual attendance in every ease. The most of the eases in col. 7 will be vaccinated in course of a short time. Very few indeed escape without being vaecinated.

83. TARBAT.—The Act works very well, eonsidering the distances many of the parents have to travel to meet the doctor. The fee presses pretty heavily on ploughmen and labourers.

### Insular.

88. Stornoway.—The vaccinators are very attentive to their duties, and parents and guardians, in general, are paying great attention to the requirements of the Act.

### 6. Inverness.

### Mainland.

91. ARDERSIER, -The Act works pretty well,

yet in many eases notices have to be issued before the certified schedules are returned. This arises from the fact that, to save trouble on their own part, parents expect either the Registrar to remind them, or the medical practitioner duly to attend to the various eases within the statutory period.

97. (1.) GLENELG.—The prevalence of Measles was the cause of postponement in six eases. The

Act is working well.

97. (2.) Knoydart.—There being no medical officer in the parish at present accounts for

there being no vaccinations for 1868.

97. (3.) NORTH MORAR.—There is considerable difficulty in getting some of the parents to comply with the requirements of the Act, eight of the 13 children whose births were registered in 1868 being as yet unvaccinated.

in 1868 being as yet unvaccinated.

1.04. Laggan.—The two eases unaccounted for are twin children of a travelling musician, who were removed from the parish the second day after their birth, and where they cannot be dis-

eovered.

106. Petty. - Vaccination, with few exceptions, is very regular.

### III.—NORTH-EASTERN DIVISION.

### 7. NAIRN.

121. AULDEARN.—There was less difficulty in obtaining the returns for 1868 than for the previous years. Only two cases eaused any great annoyance to the Registrar; the one in consequence of the ignorance of the parents, and the other on account of the child being ill for some time, and the number of Schedule B's required to be written for.

122. CAWDOR.—Cases requiring notices are

eonsiderably on the increase.

123. NAIRN.—Owing to the earelessness of parents, the proper carrying out of the spirit of the Act involves a vast amount of work most inadequately remunerated. After a five years' trial, I am still strongly of the opinion, that were the charge of one shilling made for every Registrar's notice (pursuant to see. 17) when sent out, the Vaccination Act would be better attended to, and much time and trouble saved to all parties.

### 8. Elgin (or Moray).

131. Duffus.—Inconvenience is experienced on account of there being no resident medical prac-

titioner in the parish.

132. (2.) ROTHIEMURCHUS.—Vaccination well attended to. No case of default has yet occurred, but the Act requires to be strictly enforced.

### 9. BANFF.

148. BOTRIPHNIE.—The Act works well, but

Registrars have too little pay.

153. FORDYCE.—Parties seem wishful to comply with the statute, though somewhat inclined to procrastinate, and, in consequence, in not a few cases require the Registrar's notice served on them.

157. (1.) GLENLIVAT.—Vaccination generally well attended to; a few require the statutory

notice to remind them.

164. RATHVEN.—The Aet works fairly. The only objection is the insufficient remuneration, which ought to be at least sixpense for each entry.

### 10. ABERDEEN.

182. Coult.—The schedules have been all got

in, the last one having been sent in shortly before the close of 1869. The mother was lost sight of for nearly a year.

194. Forgue.—From the Registrar's experience of the working of the Act, he would suggest that some check be imposed upon the facilities

for postponing vaccination.

199. GLASS.—The child removed from parish without being vaccinated was the illegitimate child of a farm-servant, who, along with the child, disappeared soon after the birth took place. There is no difficulty with the parents; they seem all quite willing to have their children vaccinated.

200. GLENBUCKET.—The Act is working very

well, being now better understood.

210. King-Edward.—The Act is all that could be desired, so far as it goes, with the exception of those perplexing postponements, for which the Registrars are underpaid, or rather not paid at all.

213. Kintore.—The Act works remarkably well. The duties devolving on the Registrar through its operation are, however, very trying, and the payment for the work done is very in-

adequate.

214. LEOCHEL-CUSHNIE. — There are complaints on the part of parents that the medical practitioner requires to be called upon several

times before he will vaccinate.

217. Logie-Coldstone.—Only one ease has occurred in the experience of the Registrar, of a parent delaying the vaccination of his child on the ground of entertaining objections to it; but it is becoming more and more the practice with parents to neglect the requirements of the Act, till they receive the statutory notice from the

Registrar.

220. Lumphanan.—The only difficulty that has ever occurred in working the Act, was the complaint of the poorer classes of the charges of the medical practitioners, who, on their part, were rather unwilling to go perhaps a good distance, when there was but little prospect of payment. To obviate the difficulty, the Registrar arranged with the vaccinator to attend several times a year at a central part of the parish, and vaccinate all the children of the labouring classes who should be brought to him, at a fee of 1s. 6d. prepaid. The arrangement is giving great satisfaction to both parties, as the poor get their children vaccinated at little cost, and the medical practitioner, though the fee be small, is sure of it, and it saves the Registrar from a good deal of trouble in sending notices.

233. PITSLIGO.—The Act still continues to work badly. The postponements for 1867 were 24; for 1868, 22; and for 1869, 33. As was remarked last year, a certificate of successful vaecination is rarely received without first sending a notice to the parents, and, as noted above, in 33 instances out of 78 during the year just elosed, Schedule B has been returned. This, too, is always done within the prescribed ten days (sometimes at the very last hour), so that the Registrar has had no opportunity of lodging a complaint with the Parachial Board, which might have the effect of eausing a little more punctuality to be observed. There is sometimes a suspiciously short interval between the dates of Schedules A and B. In one case a notice was sent to the parents on the 29th October: Schedule B was returned dated November 6th, and Schedule A November 22.

238. SKENE.—There is often trouble in getting in the schedules. Much of this would be avoided if the vaccinator were paid by the Parochial Board, as the Registrar is paid, and

not by the parents themselves.

### 11. KINCARDINE.

251. (1.) Banchory-Devenier.—Vaccination

attended to with punctuality.

266. Nigg.—The entry in col. 7 was that of a child which was removed to England previous to vaccination.

### IV. EAST-MIDLAND DIVISION.

### 12. FORFAR.

282. (1.) St. Peter (Dundee).—The Act is working satisfactorily. Out of the total of 891 births, 783 have been successfully vaccinated; whilst of the balance, 94 have died before vaccination, 5 have been certified as insusceptible, and only 9 have left the district before vaccina-

282. (3.) St. CLEMENT (DUNDEE).—The Act is very fairly observed, only  $3\frac{1}{2}$  per cent. of the children registered being unaccounted for. These children belong, without a single exception, to the more humble of the working classes, who in many instances have been obliged to emigrate from the town in search of employment. The Registrar continues of opinion that, if the time were restricted to three months, it would have a most beneficial effect; he observes, also, that the children of the better classes are invariably vaccinated before that time.

282. (4.) St. Andrew (Dundee).—The Act continues to work well. During the agitation in England, occasional depreciatory remarks were made to the Registrar by parents, on receiving Schedule D; but on being apprised of the remarkable fact that Small-pox was virtually an extinct disease throughout Scotland, disapproval in most cases was turned to approval. cases unaccounted for almost exclusively belong to the nomad portion of the lowest stratum of the labouring classes, who have migrated in search of work. Some of the postponements

have run nearly eighteen months.

296. Kinnell.—Vaccination remarkably well attended to.

312. Montrose.—The vaccinations are well attended to, as the return shows, although many parents require notices sent to them. Registrar may mention, as many others have done, that the remuneration is altogether inadequate to the work performed.

### 13. PERTH.

331. BALQUHIDDER.—The Act works pretty well. Parents seem to be alive to their duty under it. The chief difficulty is the distance to the vaccinator, which, with a tendency to leave vaccination undone to the last moment, leads to annoyanec to vaccinators, parents, and Registrars, that might be avoided were an endeavour made to get the children vaccinated at the third or fourth month, before teething commences.

342. Crieff.—As a rule the Act works well. In most cases, if not all, where inattention is given, the parties have left the district.

380. Methyen.—The four unaccounted for are

the children of Irish labourers, whom it is sometimes most difficult to trace.

### 14. FIFE.

411. BURNTISLAND .- As will be seen by the return, the Act is being quite successfully carried out, the whole of the entries in the Birth Register for the year having been successfully accounted

420. CUPAR.—The Act works most satisfac-

torily.

426. Dysart.—The births of 333 children

were registered in 1868. Of these, 298 were successfully vaccinated, 32 died before vaccination, and in two cases the vaccination was postponed. In the remaining case, that of an illegitimate child, the mother left the district shortly after the child's birth and before it was vaccinated, and cannot be traced.

442. Kirkcaldy.—There is still a very great amount of trouble in getting from the parents the vaccination certificates; but, by taking this trouble, the Act has wrought very successfully, as the return will show. Of the 11 cases unaccounted for, the Registrar expects to get in

certificates for seven.

453. St. Andrews and St. Leonards.—The Vaccination Act works well on the whole, and is strictly attended to by the people, except in a very few instances.

459. Wemvss.—The postponed case is that of a weakly child, running its fourth postponement.

### 16. CLACKMANNAN.

463. TILLICOULTRY.—The Act seems to work well.

### V.—WEST MIDLAND DIVISION.

### 17. STIRLING.

485. LARBERT.—Parents are all very attentive to their duties.

490. STIRLING.—The Act is still working well.

### 18. DUMBARTON.

495. CUMBERNAULD.—Some complaints occasionally of the injurious effects of vaccination in causing eruptions on head and body, and decline. In one case, a short time ago, the father of the child decidedly ascribed its death to vaccination. He brought the certificate of vaccination along with him when he came to register the death of the child.

503. Row.—The disease of small-pox is now almost unknown amongst the youthful population of the parish. The Act is now cheerfully complied with, The working population now consider compulsory vaccination a great benefit.

### 19. ARGYLL.

### Mainland.

505. (1.) Anaracle.—The only circumstance to be noted in connection with the operation of the Act in this, as in all other country districts, is the amount of trouble it gives the Registrar for the small pittance allowed him for that trouble.

510. Dunoon and Kilmun.—The schedules arc now generally returned before the six months have elapsed. The list of defaulters last half-year had only three names on it.
513. Inveraga.—There is only one case in

which no certificate has been received.

517. (2.) DALAVICH .- There are two cases of successful vaccination in which medical certificates have been refused from non-payment of fees.

521. KILMARTIN.—Vaccination continues to be well attended to. The Registrar is very seldom under the necessity of issuing notices. The parishioners seem to be fully aware that vaccination is an incalculable boon to the coun-

523. KILMORE AND KILBRIDE.—Vaccination has been suspended for the last six weeks, on

account of the prevalence of measles.

526. Lochgilphead.—One of the parochial vaccinators died in June 1869, and at his death left a number of eases of successful vaccination without eertificates. The vaccinators complained several times during the year of the inefficiency

of the lymph supplied from London.

531. (1.) SADDELL.—The entry in col. 7 is that of a defaulter from sheer neglect, who, although repeatedly warned of his duty by statutory letter and otherwise, the case also having been referred to the Inspector of Poor, continues refractory, and no certificate is yet obtained from him. The child in question was born November 2d, 1868. Another defaulter formerly reported has not yet sent any certificate regarding his daughter, born 16th July 1866.

534. (2). STRACHUR,—The Act continues to operate successfully; but the Registrar has some trouble in working it, for which labour 2s. is, in his estimation, scarcely adequate remuneration.

535. TARBERT.—Parents are getting their children vaccinated willingly, the only grudge being the payment to the vaccinator.

### Insular.

540. KILCHOMAN.—The Act continues to work satisfactorily, though the Registrar has occasionally to warn parents of the expiration of the six months, by sending statutory notices. Considering the amount of additional labour imposed upon Registrars by the Vaccination Act,

the remuneration is quite inadequate.

551. (1.) Tyree.—Vaccination is performed at the 'convenient time,' without regard to the limitations of the Act. And the convenient time for parents and vaccinator seldom happens to coincide. The fee is the principal cause of the delay on the part of the people, and where, as here, they are mostly all very poor, and the Parochial Board has to pay, it gives the Registrar a great amount of trouble. The vaccinator having to attend to the medical wants of two islands, separated by a sound often impassable for weeks, and having a population of about 5000 inhabitants, cannot always be at hand when his services may be required for vaccination.

### VI. SOUTH-WESTERN DIVISION.

### 21. Renfrew.

560. CATHCART.—It is difficult to get the medical men to send the papers, and the parents neglect to transmit them after they have received them. In this district there are remark-

ably few postponements.

564. (1.) MIDDLE DISTRICT OF GREENOCK.— Two children died from Small-pox. The one was 2 years old and born in Ireland, and the other was aged three months. They were not vaccinated.

564. (2.) East District of Greenock.-During the year two children, aged respectively about 4 years, who were born in Ircland, and

never vaccinated, died from Small-pox.
565. Houston and Killellan.—The constant changing of the labouring population is the reason why so many cases are entered in the column "Removed from the District before Vaccination, or otherwise unaccounted for," although when leaving the parents are particularly requested to send a certificate by post.

569. Kilmalcolm.—The four removals before vaccination are attributable to the migratory habits of the navvies who were working on the Greenock and Ayrshire Railway. The vaccinator of the parish is very assiduous in the dis-

charge of his duties.

571. MEARNS.—In this district the only difficulty in the working out of the Vaccination Act, is the carelessness of parents and guardians.

The notices to defaulters are sent at the end of every month, so that, generally speaking, they are never more than a week or two behind.

574. Port Glasgow.—The number of postponements in this district is very great, 113 since this time last year. This may be accounted for, to some extent, from the fact that some of the medical men are in the habit of giving eertificates of postponement instead of certificates of successful vaccination, when the parents are not able to pay the charge, 1s. 6d. The parents frequently leave the vaccination over till the six months allowed are expired, and postponement then becomes necessary, as the children then are frequently teething, so that it would be better were the time allowed shortened to four

### 22. AYR.

583. COYLTON.—The Vaccination Act works well, the people being attentive to its observance. Many, however, demur to the payment of a vaccination fee, and a number pay nothing to the medical officer. It would have been better had the Act authorized the medical officer to

uplift his fees from the registration assessment. 597. KILMARNOCK. — The Vaccination Act continues to work well, but it requires much attention on the part of the Registrar, otherwise it would be neglected by many. The greatest difficulty encountered is getting returns from those who remove from the district, in most of which cases the parties cannot be traced. The unaccounted for and removed during 1868 are 14, which is double the number of the previous year.

598. KILMAURS.—There is no difficulty in getting the provisions of the statute carried ont.

609. OCHILTREE.—The working of the Act has hitherto been a complete success. Its influence is demonstrated by the fact, that for years there has not been a single case of Smallpox in the parish.

### 23. Lanark.

644. (3.) BRIDGETON (GLASGOW).—The vaccination certificates, as usual, have been well returned, there being only 53 removed from the district before vaccination or otherwise unaccounted for, out of 2198 births. During the year, there were no cases of Small-pox.

644. (9.) TRADESTON (GLASGOW).—For 1868 there are only 23 defaulters out of 1897 entries. Having come across the following interesting paragraph relative to vaccination in an address delivered by Dr. Valentine, physician to His Highness the Maharajah of Jeypore, India, I have taken the liberty to extract it. He says: One peculiar feature attending the labours of the medical missionary in that part of the country, was the readiness with which the women came forward of their own accord to have their children vaccinated.' (Vide'United Presbyterian Missionary Record' for December 1869.)
652. (3.) EASTERN DISTRICT OF OLD MONK-LAND.—The dulness of the iron trade during the

year 1868 was the cause of five families leaving the county, which necessitated the sending of 40 vaccination notices. This is some proof of the arduous duties entailed upon the Registrar.

654. RUTHERGLEN. — The Vaccination Act eontinues to work well, though many of the parents require notices sent them, in order that the schedule may be returned within the specified time. One man has absolutely refused to get his child vaccinated, and the case has been handed over to the Parochial Board.

656. STONEHOUSE.—Vaccination is extremely

well attended to.

660. WISTON AND ROBERTON.—At times it is rather troublesome to get the statutory provisions complied with, and much attention is required to get the parties to return the schedules in time. And all for threepence each!

### VII.—SOUTH-EASTERN DIVISION.

### 25. Edinburgh.

689. Inveresk and Musselburgh.—As stated in my last report, the period of six months seems too long, and allows many to get away from the district.

695. NEWBATTLE.—The Registrar frequently does not receive the certificate of successful vaccination till long after date, owing to the medical men retaining it till they enforce payment of their account. The medical men are extremely remiss in regard to certificates of all sorts. For example, the Registrar has to-day received a successful vaccination certificate in which the doctor has only filled in the child's name, dated and signed the schedule, without giving the father's name, residence, or the district and county of birth. One in fifty of the medical certificates (Schedule G) is not received till a requisition is sent. All this entails endless and unrequited trouble on Registrars.

### 26. HADDINGTON.

725. Yester.—The certificates have been punctually delivered to me within the time prescribed.

### 27. Berwick.

730. Chirnside.—The Vaccination Act continues to work well. During the past year the Registrar had only to send one notice, which was instantly attended to.

733. Coldstream.—The Vaccination Act is working remarkably well; even parties who have removed to England are careful to send certificates of vaccination, though performed by English practitioners.

736. Earlston.—In most cases the requirements of the Vaccination Act have been com-

plied with within the statutory period. 748. LAUDER.—No part of the Registrar's work costs so much trouble as the Vaccination Act. Every now and again a day has to be devoted towards liunting up defaulters.

### 28. PEEBLES.

766. Manor.—The Vaccination Act is strictly

attended to, there having been no defaulters in any one ease since the new system of vaccination came into operation.

771. TRAQUAIR.—A few cases occurred requiring notices, but the parents generally blamed

the medical attendant.

### VIII. SOUTHERN DIVISION.

### 30. Roxburgh.

787a. Eckford. — The Registrar has considerable difficulty in getting the certificates lodged within the statutory period, the parents saying that the fault lies with the doctor, who is not at home when they go with the child for vaccination. One told me that his wife had been once at Jedburgh and twice at Kelso before she could get the operation performed.

790. Hobkirk.—As regards the vaccination of their children, parents are very attentive.

811. YETHOLM.—A medical man being stationed in the parish, the schedules are regularly sent in.

### 31. Dumfries.

828. Half-Morton.—With one exception, I have had no difficulty in getting the vaccination certificates; but there is a tendency to postpone the vaccination to the limit of the time allowed.

840. Lochmaben. — Parents appear not to take so much trouble upon themselves as in former years, and thus greater attention on the

part of the Registrar is required.

850. Torthorwald.—Among the labouring population there is general murmuring at being obliged to carry their infants, during all seasons, so far as Dumfries, and, in addition, to have to pay two shillings or half-a-crown to the vaccinator. A number have required to be served with the statutory notices.

### 32. Kirkcudbright.

858. Borque. — The Vaccination Act has worked well.

862. Corsock Bridge. — The Vaccination Act is still working well.

### 33. WIGTOWN.

901. Wigtown. — Vaccination is generally well attended to, but a few require to be reminded by having notice sent them. The two postponements are in consequence of the children having skin disease.
